

Algeria energy storage policy

Overview

Algeria does not yet have a national energy storage strategy, despite the growing integration of intermittent solar power. Battery storage and pumped hydro could enhance grid flexibility, support hydrogen electrolysis efficiency, and ensure system resilience. Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. This article explores policy frameworks, technological innovations, and market opportunities in renewable energy integration. With solar irradiation levels exceeding 2,000 kWh/m². In 2015, the country updated its Renewable Energy and Energy Efficiency Development Plan to 2030, and put greater focus on the deployment of large-scale renewables, including solar PV and onshore wind installations, through various incentive measures. Algeria, like many other oil-exporting nations, faces vulnerabilities. With major reserves of phosphate and barium, Algeria has the potential to drive innovation in energy storage and battery production.
