

# **Bidirectional charging of energy storage containers for power stations**

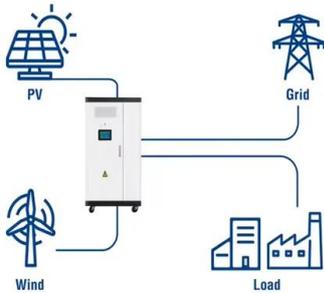

## Overview

---

Bi-directional charging allows EVs to function as mobile energy storage units. Equipped with this technology, EVs can not only draw power from the grid but also return electricity to it, or supply power to homes during peak demand or in the event of blackouts. Lithium-ion batteries have emerged as the current dominant technology, offering improved energy densities, cycle life, and reliability. Meanwhile, lower-cost alternatives to lithium, such as sodium-sulphur, are also being developed. This breakthrough opens up new. As the federal government moves toward fleet electrification, site decarbonization, and deployment of local distributed energy resources (DERs), agencies should consider both managed and bidirectional charging. We examine pilot projects and business use cases, focusing on Building Integrated Vehicle Energy Solutions (BIVES) and Resilient Energy Storage and Backup (RESB) as. Bidirectional EV charging technology enables vehicles to serve as mobile power stations while promising billions in utility savings.
