

Common heights of EMS for communication base stations

Overview

Cellular or PCS cell site towers are typically 50-200 feet high. Antennas are usually arranged in groups of three, with one antenna in each group used to transmit signals to mobile units, and the other two antennas used to receive signals from mobile units. (1) Base stations with an emission bandwidth of 1 MHz or less are limited to 1640 watts equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT, except as described in paragraph (b) below. Emergency communications systems (ECS) shall consist of two classifications of systems, one-way and two-way. Design documents shall be present s-built conditions for analysis s of occupancy, and perceived g, area. Generally uses a low output of between 50 and 75 watts of transmission power B. Generally uses a low output of between 50 and 75. Primary antennas for transmitting wireless telephone service, including cellular and Personal Communications Service (PCS), are usually located outdoors on towers, water tanks and other elevated structures like rooftops and sides of buildings. Fire Administration, "Safety and Health Considerations for the Design of Fire and Emergency Medical Services Stations" which is in the public domain. This report was developed through a cooperative research agreement between the U. Fire Administration (USFA).

Common heights of EMS for communication base stations

eCFR :: 47 CFR 24.232 -

§ 24.232 Power and antenna height limits. (a) (1) Base stations with an emission bandwidth of 1 MHz or less are limited to 1640 watts equivalent isotropically radiated power (EIRP) with an antenna height ...
