

High power inverter grounding

Overview

An ungrounded inverter will contain live points, which, when touched, will send a current through your body to the earth. Your body has completed the loop to earth. Inverters should always be grounded to a single grounding point. System grounding Ground or earth provides a common return path for electric current in an electric circuit. Grounding is needed for electric safety and it also creates a reference point. There are fundamental differences between inverter-based and synchronous machine generation that impact traditional power system effective grounding practices and guidelines. Inverters behave as constant current or constant power sources with respect to their contribution to fault currents and to. not solidly grounded. Wagan PureLine Power Inverters item.
