

How much is the hidden crack degree of photovoltaic panels

Overview

Some research determined that losses of up to 2. Larger losses can be experienced for a module with micro-cracks that do isolate parts of the cell. Micro-cracks represent a form of solar cell degradation and can affect both energy output and the system lifetime of a solar photovoltaic (PV) system. The silicon used in solar PV cells is very thin (in the range of 180 +/- 20 microns) and hence is susceptible to damage easily if the PV module's. Photovoltaic cell cracks, also known as microcracks, are defects formed in crystalline photovoltaic cells. Cracks are often invisible to the bare eye; the current standard cracks detection method uses Electroluminescence (EL) imaging [18, 19, 20]. As noticed, multiple cracks appear in the EL image, where in fact, the detection of the crack have been improved using the proposed algorithm he cracks using the low-resolution CCD detector.
