

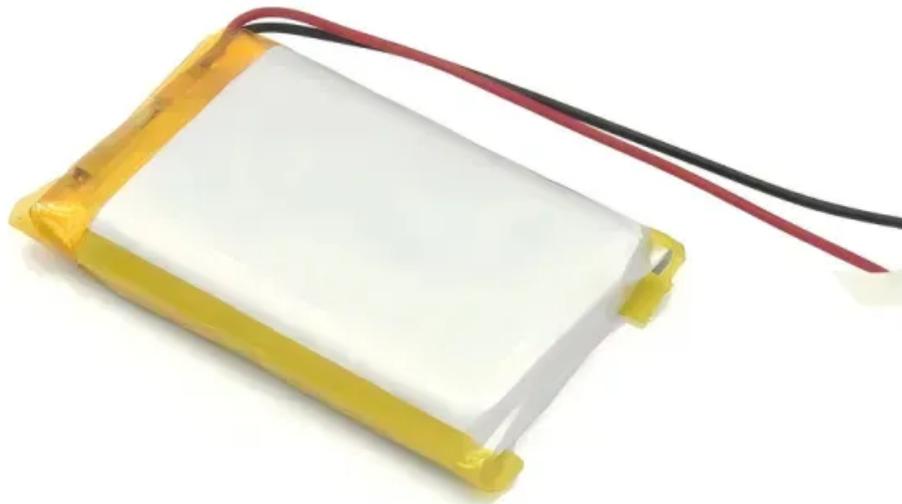

Photovoltaic panels buried lightning protection line

Overview

Lightning protection systems (LPS) provide a protective zone to assure against direct strikes to PV systems by utilizing basic principles of air terminals, down conductors, equipotential bonding, separation distances and a low-impedance grounding electrode system. Solar PV systems are designed to collect energy from sunlight, but they also have large metallic components including panels, frames, and mounts, along with extensive electrical wiring. Both metal and wiring serve as excellent paths for electrical currents, making solar installations natural. Lightning is a common cause of failures in photovoltaic (PV) and wind-electric systems. But most lightning damage is preventable. Single air terminals offer a cone.

Array Wiring & "Twisted Pair" Technique
Additional Lightning Protection
Lightning Arrestors
Lightning Rods
Out of Sight, Not Out of Mind
A lot of lightning protection work is buried and out of sight. To help ensure that it gets done correctly, write it into your contract(s) with your system installer, electrician, excavator, plumber, well driller, or anyone doing earthwork that will contain your grounding system.
