

Photovoltaic panels have glue accumulation phenomenon

Overview

Dust accumulation on the surface of the panels increases thermal resistance, effectively forming an insulating layer that hinders heat dissipation. The dust deposition on the surfaces is a complex phenomenon which depends on a large number of different environmental and technical factors, such as location, weather parameters, pollution, tilt angle and surface roughness. In solar manufacturing, this adhesive magic determines whether your panel lasts 25 years or becomes tomorrow's landfill decoration. Dust accumulation is a critical factor that can significantly reduce the efficiency of solar power generation. It has been estimated that dust pollution can reduce the energy output of photovoltaic (PV) plants by at least 5% annually.
