

Photovoltaic support load test procedures

Overview

The UL 2703 wind and snow load testing protocols are comprehensive. They involve applying uplift, downforce, and parallel forces to the assembled system to simulate real-world conditions. Piles are used to support trackers and panels. Because of the potential for variability in the type of reaction force utilized during pile load testing, ensuring accuracy in pile load testing is a critical part. Can a stand-alone photovoltaic system be tested?

Abstract: Tests to determine the performance of stand-alone photovoltaic (PV) systems and for verifying PV system design are presented in this recommended practice. The methodology includes. In order to determine the ground bearing capacity, the most usual is to use real-scale load tests after analyzing and characterizing the ground using geotechnical field and laboratory tests.
