

# Solar panel voltage 8v

## Overview

---

To be more accurate, a typical open circuit voltage of a solar cell is 0.58 volts (at 77°F or 25°C). All the PV cells in all solar panels have the same 0.58V. This sounds a bit weird, but it's really not. This is the voltage. Simply put, voltage (V) is the electrical potential or “pressure” that drives current through your solar system. You would expect to see this number listed on a PV module's specification sheet and sticker. This voltage is used when testing modules fresh out of the box and used later. To determine the wattage of an 8V solar charging panel, several factors need to be taken into account. Their voltage fluctuates wildly with environmental conditions, creating both opportunities and hazards for off-grid power users.
