

Solar power generation light waves

Overview

Solar panels are engineered to absorb light within a specific range of wavelengths, known as the “band-gap. ” This band-gap plays a crucial role in solar energy generation. Determining the most efficient wavelength of light would allow us to improve solar panel. Solar cells depend on a phenomenon known as the photovoltaic effect, discovered by French physicist Alexandre Edmond Becquerel (1820-1891). It is related to the photoelectric effect, a phenomenon by which electrons are ejected from a conducting material when light shines on it. The visible spectrum and some infrared and ultraviolet wavelengths are most effective for solar panels, while X-rays and gamma rays are too.
