Overview

Compared with photovoltaic (PV) or solar thermal (ST) system alone, the hybrid photovoltaic/thermal (PV/T) system has many advantages such as simultaneous production of electrical and thermal energies, efficient utilization on solar energy, space reduction and so on. An integrated system for the SPT plant was created in this work consisting recuperative organic Rankine cycle (RORC) as the bottoming cycle, whereas the helium Brayton cycle (HBC) was regarded as the topping cycle. Engineering equation solver software was used to do the energy, exergy. In this paper, energy and exergy analysis of a bidirectional solar thermoelectric generator (STEG) coupled to a latent heat storage and cooling system (LHSCS) has been carried out. However, there is limited data.
