

# What is the required temperature of the energy storage system

## Overview

---

Energy storage installations should ideally maintain a temperature range within 0°C to 40°C. Optimal temperature ranges for various types of energy storage technologies promote longevity and performance; 3. Thermochemical storage converts heat into chemical bonds, which is reversible and beneficial for long-term storage applications. High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat. Thermal energy storage (TES) stockpiles thermal energy by heating or cooling a storage medium for later use in heating and cooling applications and power generation.
