

# Wind power generation is AC

LFP 280Ah C&I

## Overview

---

Wind turbines work by turning the blades of the turbine, causing the axis to rotate and connecting to a generator that produces DC electricity. This DC electricity is then converted to AC via an inverter for home use. As the wind turns the rotor, it spins a shaft attached to the generator, generating magnetic fields which rotate around the stator windings, resulting in AC voltage via Faraday's. A wind turbine works by catching the energy in the wind, using it to turn the blades, and converting the energy to electricity through a generator in the part of the turbine called a nacelle. Wind is a form of solar energy caused by a.
